

## Do some of your tanks lack of automatic level measurement equipment but you would like these to be visualized in SiteInfo?

Site Basic, or manual monitoring as it is called, is a tool for tanks that don't have automatic level measurement. The function can be used by supplier in order to receive information from the individual customers when it is time to deliver new product.

As a supplier, you can easily control 100% of the products and delivery planning. By using SiteBasic, there's no need to invest in level measurement equipment while benefiting from the visualization of the tank content in SiteInfo.

### How to get access to the feature

- The virtual site is set up on SiteInfo while the tank identifier plate is sent to the site.
- You will be able to grant your customer the authority to insert manual monitoring while notifying your customer that it has the authority to insert values.
- The identifier plate is positioned by the tank at the site. In case the tank is in an EX-zone, it is mandatory to position the plate outside the EX-zone as the reporting of the manual values is performed in the SiteInfoApp by smartphone.
- Your customer detects the current level of the tank, scans the QR-code on the plate and insert the manual values measured in the SiteInfoApp by using their smartphones.
- The supplier of the product subsequently checks and verifies the site and tank information and sets the tank in operation.
